Cloud Console tidy-up: three jobs

Simple steps and when it is safe. RMD website project, Google Cloud Console. Written 21 Oct 2026.

WHEN TO DO EACH ONE

1. Delete the Gemini key
Safe now, before Monday. Nothing in the website code uses it.

2. App Engine Editor role
After assessment night. Earliest Tue 27 Oct, in the daytime.

3. Owner on email.rmd.uk
After assessment night. Earliest Wed 28 Oct, in the daytime.

Rules for all three. One job per day. Do it before 3 pm so you can test it. Never on the morning of a course, or the evening before one. After each job, check the next 06:00 email run worked before starting the next job. Every step below can be undone.

1. Delete the unused "RMD - gemini" API key SAFE NOW

1. Open `console.cloud.google.com`. Check the project name at the top is the RMD one.
2. Menu, then **APIs & Services**, then **Credentials**.
3. Under **API keys**, click the Gemini key name. Under restrictions it should say Generative Language API only.
4. Check it is not the website key. Click **Show key**. Compare the first 8 characters with the `apiKey` in `js/firebase-config.js`. They must be different.
5. Optional: **APIs & Services**, **Enabled APIs**, **Generative Language API**, **Metrics**. Zero requests in the last 30 days confirms nobody uses it.
6. Back on Credentials, tick the Gemini key and click **Delete**. Confirm.

Undo: a deleted key can be restored for 30 days, then it is gone for good. A deleted key can keep working for a few minutes. **Test:** open rmd.uk.com, sign in, open the Phase 1 hub. It should work as before.

2. Narrow the App Engine default service account's Editor role AFTER MONDAY

1. Menu, then **IAM & Admin**, then **IAM**.
2. Find `PROJECT-ID@appspot.gserviceaccount.com` (App Engine default service account). Note the roles shown.
3. Click the **excess permissions** number on its row. Read what Google says is unused in the last 90 days.
4. Click the pencil. Click **Add another role** and add the narrow roles you need. Likely: **Cloud Datastore User** (Firestore) and **Secret Manager Secret Accessor** (the email key). Save.
5. Test now (checklist below). Only then go back, click the pencil, and remove **Editor**. Save.
6. Test again. Check the Cloud Scheduler job ran at 06:00 the next day.

Also: your functions are the newer type, so they most likely run as the **Compute Engine default service account** (`PROJECT-NUMBER-compute@developer.gserviceaccount.com`), which usually also has Editor. That one matters more. Do it as job 2b, a different day, same steps. **Undo:** re-add Editor on the same page. It takes effect within a minute or two.

3. Narrow the Owner role on email.rmd.uk@gmail.com AFTER MONDAY

1. **IAM & Admin**, **IAM**. Find `email.rmd.uk@gmail.com`. Note its roles.
2. Check you have another **Owner** (your own Google account). If not, click **Grant access**, add yourself as Owner, Save. Do this first. Never remove the only Owner.
3. Decide what this account does. If it is only a mailbox or an email sender, **Viewer** is enough. If it deploys code, keep Firebase Admin only.
4. Click the pencil, add the narrower role, Save. Then click the pencil again, remove **Owner**, Save.
5. Test (below). Sign in to Firebase Console with that account if you use it for that.
6. Separately: turn on 2-step verification for that Gmail and check the recovery phone or email is one you control.

Undo: sign in with your own Owner account, give the role back on the same page.

Test checklist after a role change (5 minutes). 1) Send a bulk comms email to your own address. 2) Open the Phase 1 hub on the test course and open Assessor, Runner and the Flow screen. 3) Firebase Console, Functions: no new red errors. 4) Next morning, Cloud Scheduler: last run shows Success. If anything fails, put the role back first, then work out why.
